#### TYPICAL APPLICATION

$$V_{OUT} = 1.25V(1+R_2/R_1)+I_{ADJ}R_2$$

Note 1.  $C_{IN}$  is required when regulator is located in appreciable distance from power supply filter.

Note 2.  $C_{OUT}$  is not needed for stability, however, it does improve transient response.

Note 3.  $I_{ADJ}$  is controlled to less than 100 $\mu A$ , the error associated with this term is negligible in most applications.
