Features

- **Fast**
 - 38-ns clock cycle (commercial)
 - 42-ns clock cycle (military)
- **Low power**
 - I_{CC} (max. at 10 MHz) = 100 mA (commercial)
 - I_{CC} (max. at 10 MHz) = 110 mA (military)
- **V_{CC} margin of 5V \pm 10%**
 - All parameters guaranteed over commercial and military operating temperature range

- **16 x 16 bit parallel multiplication with full precision 32-bit product output**
- **Two's complement, unsigned magnitude, or mixed-mode multiplication**
- **CY7C516 is pin compatible and functionally equivalent to Am29516, MPY016K, MPY016H**
- **CY7C517 is pin compatible and functionally equivalent to Am29517**

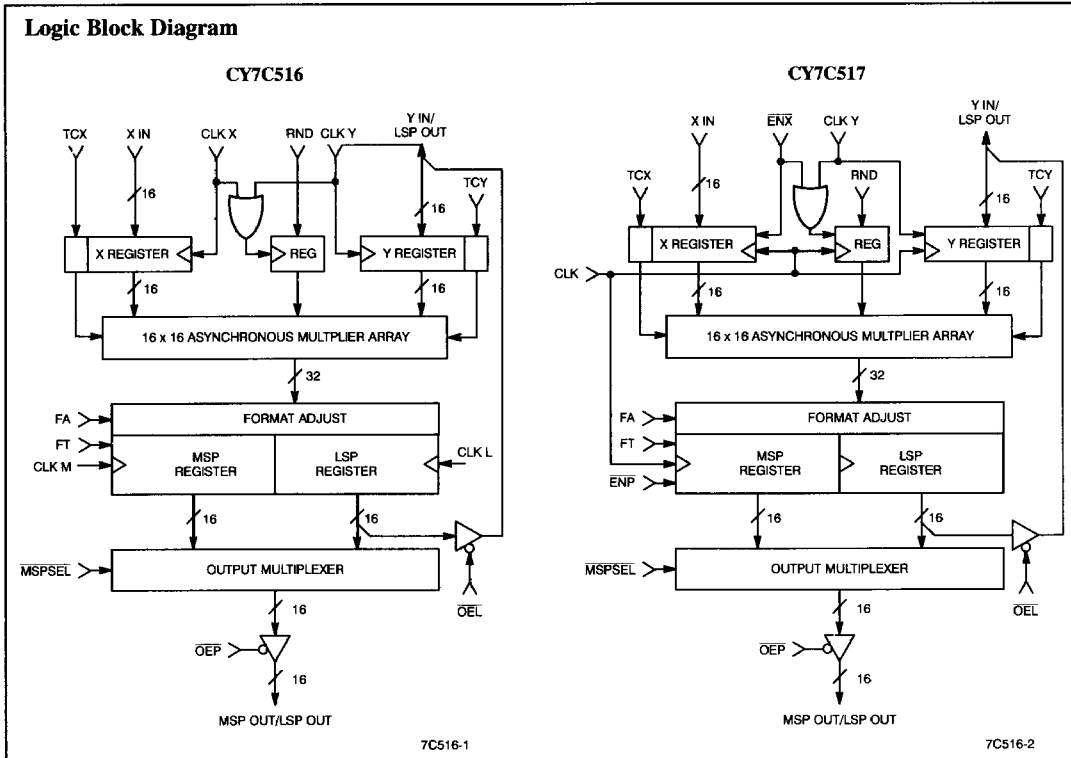

Functional Description

The CY7C516/517 are high-speed 16 x 16 parallel multipliers that operate at 38-ns clocked multiply times (26-MHz multiplication rate). The two input operands may

be independently specified as either two's complement or unsigned magnitude numbers. Controls are provided for rounding and format adjustment of the full-precision 32-bit product.

On the 7C516, individually clocked input and output registers are provided to maximize throughput and to simplify bus interfacing. On the 7C517, a single clock (CLK) is provided, along with three register enables. This facilitates the use of the 7C517 in microprogrammed systems. The input and output registers are positive-edge-triggered D-type flip-flops. The output register may be made transparent for asynchronous output.

Functional Description (continued)

Two output modes may be selected by using the output multiplexer control, MSPSEL. Holding MSPSEL LOW causes the most significant product (MSP) to be available at the dedicated output port. The LSP is simultaneously available at the bidirectional port shared with the Y inputs.

The other mode of output involves toggling the MSPSEL control, to allow both the MSP and LSP to be available for output through the dedicated 16-bit output port.

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Ambient Temperature Under Bias	- 55°C to +125°C
Supply Voltage to Ground Potential	- 0.5V to +7.0V
DC Input Voltage	- 0.5V to +7.0V
DC Voltage Applied to Outputs	- 0.5V to V _{CC} Max.
Output Current into Outputs (LOW)	10 mA
Static Discharge Voltage	>1000V (Per MIL-STD-883 Method 3015)

Pin Definitions

Signal Name	I/O	Description
X ₁₅ - X ₀	I	X-Input Data. This 16-bit number may be interpreted as two's complement or unsigned magnitude.
Y ₁₅ - Y ₀ (P ₁₅ - P ₀)	I O	Y-Input/LSP Output Data. This 16-bit number may be interpreted as two's complement or unsigned magnitude.
P ₃₁ - P ₁₆ (P ₁₅ - P ₀)	O	MSP-Out/LSP-Out. This 16-bit port may carry either the MSP (P ₃₁ - P ₁₆) or the LSP (P ₁₅ - P ₀).
FT	I	The MSP and LSP registers are made transparent (asynchronous operation) if FT is HIGH.
FA	I	Format Adjust Control. If FA is HIGH, a full 32-bit product is output. If FA is LOW, a left-shifted product is output, with the sign bit replicated in the LSP. FA must be HIGH for two's complement integer, unsigned magnitude, and mixed-mode multiplication.
MSPSEL	I	Output Multiplexer Control. When MSPSEL is LOW, the MSP is available for output at the MSP output port, and the LSP is available at the Y input/LSP output port. When MSPSEL is HIGH, the LSP is available at both ports (above) and the MSP is not available.
RND	I	Round Control. When RND is HIGH, a one is added to the MSB of the LSP. This position is dependent on the FA control; FA = HIGH means RND adds to the 2 ⁻¹⁵ bit (P ₁₅). FA = LOW means RND adds to the 2 ⁻¹⁶ bit (P ₁₄).
TCX	I	Two's Complement Control X. X-input data are interpreted as two's complement when TCX is HIGH. TCX LOW means the data are interpreted as unsigned magnitude.
TCY	I	Two's Complement Control Y. Y-input data are interpreted as two's complement when TCY is HIGH. TCY LOW means the data are interpreted as unsigned magnitude.

Signal Name	I/O	Description
OE _P	I	MSP-Out/LSP-Out Three-State Control. When OE _P is LOW, the output port is enabled; when OE _P is HIGH, drivers are in a high-impedance state.
OE _L	I	Y-In/LSP Out Three-State Control. When OE _L is LOW, the timeshared port is enabled for LSP output. When OE _L is HIGH, the output drivers are in a high-impedance state. This is required for Y input.
CY7C516 Only		
CLK X	I	X-Register Clock. X-input data and TCX are latched in at the rising edge of CLK X.
CLK Y	I	Y-Register Clock. Y-input data and TCY are latched in at the rising edge of CLK Y.
CLK M	I	MSP Register Clock. The most significant product (MSP) is latched in at the rising edge of CLK M.
CLK L	I	LSP Register Clock. The least significant product (LSP) is latched in at the rising edge of CLK L.
CY7C517 Only		
CLK	I	Clock. All enabled registers latch in their data at the rising edge of CLK.
EN _X	I	X-Register Enable. When EN _X is LOW, the X register is enabled. X-input data and TCX will be latched in at the rising edge of CLK when the register is enabled. When EN _X is HIGH, the X register is in hold mode.
EN _Y	I	Y-Register Enable. EN _Y enables the Y register (see EN _X).
EN _P	I	Product Register Enable. EN _P enables the product register. Both the MSP and LSP sections are enabled by EN _P (see EN _X).

Notes:

- See the last page of this specification for Group A subgroup testing information.
 - Not more than one output should be shorted at a time. Duration of the short circuit should not be more than one second.
 - Two quiescent figures are given for different input voltage ranges. To calculate I_{CC} at any given clock frequency, use 30 mA + I_{CC}(AC)
 - Tested initially and after any design or process changes that may affect these parameters.
- where I_{CC}(AC) = (7 mA/MHz) × Clock Frequency for the commercial temperature range. I_{CC}(AC) = (8 mA/MHz) × Clock Frequency for military temperature range.
