GT7041

Super Low power, CMOS, Rail-to-Rail Operational Amplifier Advanced

1. Features

- Single-Supply Operation from +1.4V to +5.5V
- Rail-to-Rail Input/Output
- Gain-Bandwidth Product: 9KHz
- Low Input Bias Current: 1pA
- Low Offset Voltage: 1mV
- Quiescent Current: 400nA
- Available in Space-Saving Packages:
- SOP-8 and SOT23-5 Packages

2. General Description

The GT7041 series amplifiers are single supply, low power CMOS dual operational amplifier, these amplifiers offer bandwidth of 9KHz, rail-to-rail inputs and outputs, and single-supply operation from 1.4V to 5.5V. Low quiescent supply current of 1μA and very low input bias current of 1pA make the devices an ideal choice for low offset, low power consumption and high impedance applications such as smoke detectors, photodiode amplifiers, and other sensors.

The GT7041 is available in SOP-8 and SOT23-5 packages. The extended temperature range of -40°C to +85°C over all supply voltages offers additional design flexibility.

3. Applications

- Portable Equipment
- Mobile Communications
- Smoke Detector
- Sensor Interface
- Medical Instrumentation
- Battery-Powered Instruments
- Handheld Test Equipment

4. Pin Configuration

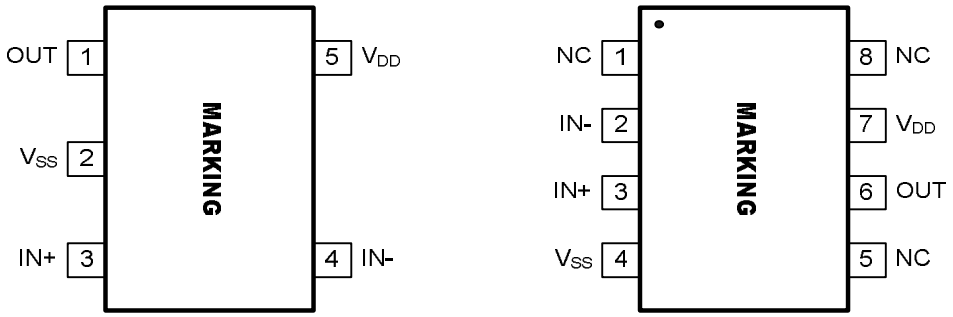

Figure 1. Pin Assignment Diagram (SOP8 and SOT23-5 Package)

Note: Please see section "**Part Markings**" for detailed Marking Information.

5. Application Information

5.1 Size

GT7041series op amps are unity-gain stable and suitable for a wide range of general-purpose applications. The small footprints of the GT7041 series packages save space on printed circuit boards and enable the design of smaller electronic products.

5.2 Power Supply Bypassing and Board Layout

GT7041 series operates from a single 1.4V to 5.5V supply or dual ±0.7V to ±2.75V supplies. For best performance, a 0.1μF ceramic capacitor should be placed close to the V_{DD} pin in single supply operation. For dual supply operation, both V_{DD} and V_{SS} supplies should be bypassed to ground with separate 0.1μF ceramic capacitors.

5.3 Low Supply Current

The low supply current (1.4μA) of GT7041 series will help to maximize battery life. They are ideal for battery powered systems

5.4 Operating Voltage

GT7041 series operate under wide input supply voltage (1.4V to 5.5V). In addition, all temperature specifications apply from -40°C to +125°C. Most behavior remains unchanged throughout the full operating voltage range. These guarantees ensure operation throughout the single Li-Ion battery lifetime

5.5 Rail-to-Rail Input

The input common-mode range of GT7041 series extends 100mV beyond the supply rails (V_{SS}-0.1V to V_{DD}+0.1V). This is achieved by using complementary input stage. For normal operation, inputs should be limited to this range.

5.6 Rail-to-Rail Output

Rail-to-Rail output swing provides maximum possible dynamic range at the output. This is particularly important when operating in low supply voltages. The output voltage of GT7041 series can typically swing to less than 10mV from supply rail in light resistive loads (>100kΩ), and 60mV of supply rail in moderate resistive loads (10kΩ).

5.7 Capacitive Load Tolerance

The GT7041 series can directly drive 250pF capacitive load in unity-gain without oscillation. Increasing the gain enhances the amplifier's ability to drive greater capacitive loads. In unity-gain configurations, the capacitive load drive can be improved by inserting an isolation resistor R_{ISO} in series with the capacitive load, as shown in Figure 1.

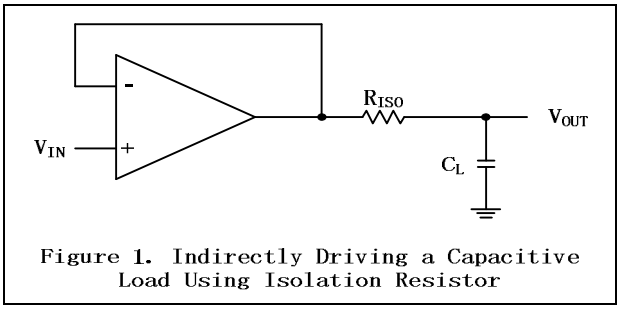

Figure 1. Indirectly Driving a Capacitive Load Using Isolation Resistor

The bigger the R_{ISO} resistor value, the more stable V_{OUT} will be. However, if there is a resistive load R_L in parallel with the capacitive load, a voltage divider (proportional to R_{ISO}/R_L) is formed, this will result in a gain error.

The circuit in Figure 2 is an improvement to the one in Figure 1. R_F provides the DC accuracy by feed-forward the V_{IN} to R_L. C_F and R_{ISO} serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving the phase margin in the overall feedback loop. Capacitive drive can be increased by increasing the value of C_F. This in turn will slow down the pulse response.

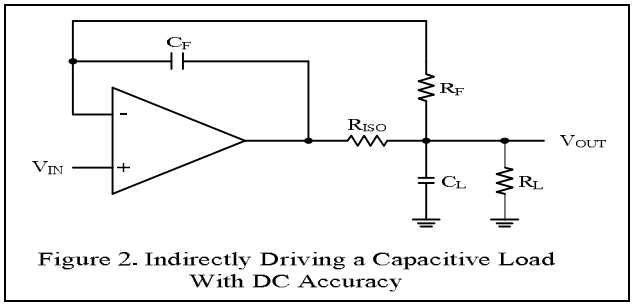

Figure 2. Indirectly Driving a Capacitive Load With DC Accuracy

5.8 Differential amplifier

The differential amplifier allows the subtraction of two input voltages or cancellation of a signal common the two inputs. It is useful as a computational amplifier in making a differential to single-end conversion or in rejecting a common mode signal. Figure 3 shown the differential amplifier using GT7041.

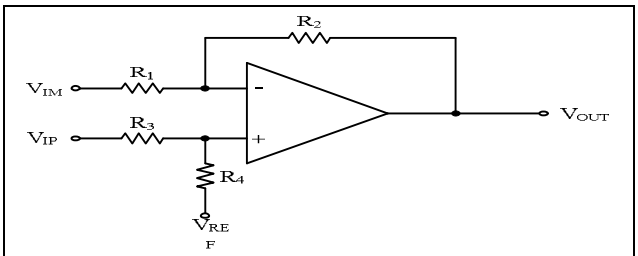

Figure 3. Differential Amplifier

$$V_{out}=\left(\frac{R1+R2}{R3+R4}\right)\frac{R4}{R1}V_2-\frac{R2}{R1}V_1+\left(\frac{R1+R2}{R3+R4}\right)\frac{R3}{R1}\frac{V^+}{2}$$

If the resistor ratios are equal (i.e. R_1=R_3 and R_2=R_4), then

$$V_{out}=\frac{R_2}{R_1}(V_2-V_1)+\frac{V^+}{2}$$

5.9 Instrumentation Amplifier

The input impedance of the previous differential amplifier is set by the resistors R_1, R_2, R_3, and R_4. To maintain the high input impedance, one can use a voltage follower in front of each input as shown in the following two instrumentation amplifiers.

5.10 Three-Op-Amp Instrumentation Amplifier

The quad GT7041 can be used to build a three-op-amp instrumentation amplifier as shown in Figure 4.

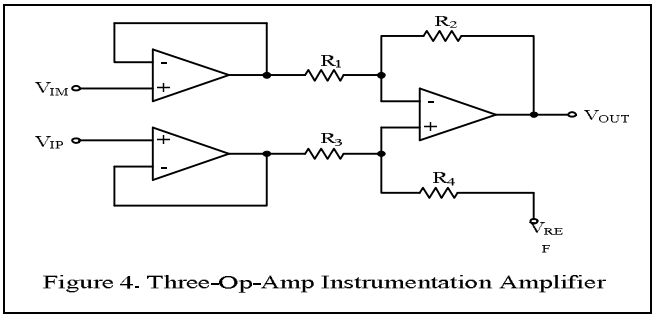

Figure 4. Three-Op-Amp Instrumentation Amplifier

The amplifier in Figure 4 is a high input impedance differential amplifier with gain of R_2/R_1. The two differential voltage

followers assure the high input impedance of the amplifier.

5.11 Two-Op-Amp Instrumentation Amplifier

GT7041 can also be used to make a high input impedance two-op-amp instrumentation amplifier as shown in Figure 5.

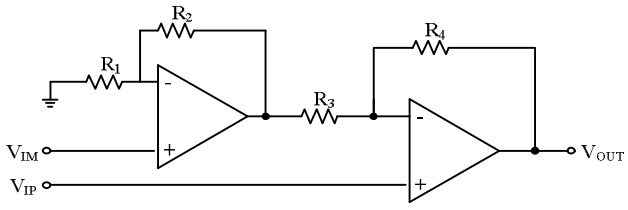

Figure 5. Two-Op-Amp Instrumentation Amplifier

$V_o = (1 + \frac{R_4}{R_3})(V_2 - V_1)$

Where R_1=R_3 and R_2=R_4. If all resistors are equal, then V_o=2(V_2-V_1)

5.12 Single-Supply Inverting Amplifier

The inverting amplifier is shown in Figure 6. The capacitor C_1 is used to block the DC signal going into the AC signal source V_{IN}. The value of R_1 and C_1 set the cut-off frequency to f_C=1/(2πR_1C_1). The DC gain is defined by V_{OUT}=-(R_2/R_1)V_{IN}

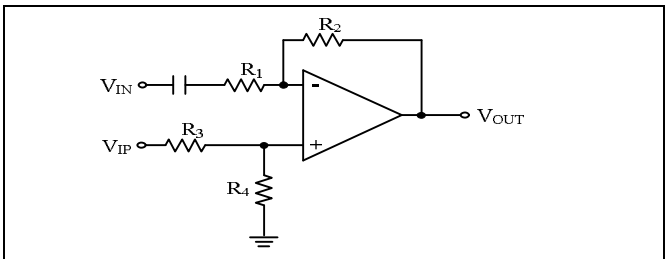

Figure 6. Single Supply Inverting Amplifier

5.13 Low Pass Active Filter

The low pass active filter is shown in Figure 7. The DC gain is defined by –R_2/R_1. The filter has a -20dB/decade roll-off after its corner frequency f_C=1/(2πR_3C_1).

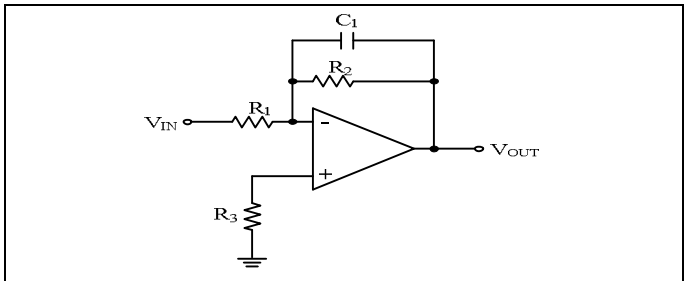

Figure 7. Low Pass Active Filter

5.14 Sallen-Key 2nd Order Active Low-Pass Filter

GT7041 can be used to form a 2nd order Sallen-Key active low-pass filter as shown in Figure 8. The transfer function from V_{IN} to

V_{OUT} is given by $$\frac{V_{OUT}}{V_{in}}(S)=\frac{\frac{1}{C_1C_2R_1R_2}A_{LP}}{S^2+S(\frac{1}{C_1R_1}+\frac{1}{C_1R_2}+\frac{1}{C_2R_2}-\frac{A_{LP}}{C_2R_2})+\frac{1}{C_1C_2R_1R_2}}$$

Where the DC gain is defined by $A_{LP}=1+R_3/R_4$, and the corner frequency is given by $\omega_C = \sqrt{\frac{1}{C_1C_2R_1R_2}}$

The pole quality factor is given by $\frac{\omega C}{Q}=\frac{1}{C_1R_1}+\frac{1}{C_1R_2}+\frac{1}{C_2R_2}-\frac{A_{LP}}{C_2R_2}$

Let R1=R2=R and C1=C2=C, the corner frequency and the pole quality factor can be simplified as below

$\omega_C=\frac{1}{CR}$ And $Q=2-R_3/R_4$

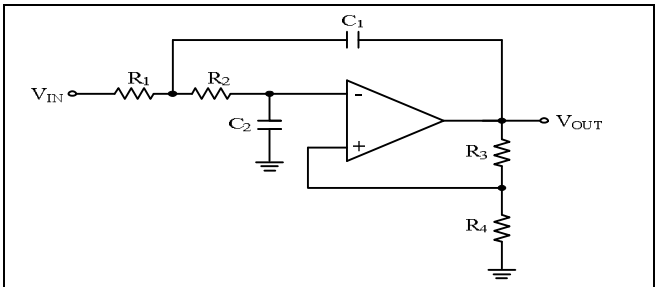

Figure 8. Sanllen-Key 2nd Order Active Low-Pass Filter

5.15 Sallen-Key 2nd Order high-Pass Active Filter

The 2nd order Sallen-key high-pass filter can be built by simply interchanging those frequency selective components R_1, R_2, C_1, and C_2 as shown in Figure 9.

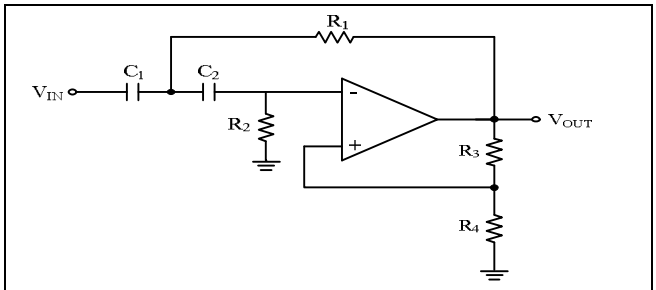

Figure 9. Sanllen-Key 2nd Order Active High-Pass Filter

$$\frac{V_{OUT}}{V_{IN}}(S)=\frac{S^2A_{HP}}{S^2+S(\frac{1}{C_1R_1}+\frac{1}{C_2R_2}+\frac{1-A_{HP}}{C_1R_1})+\frac{1}{C_1C_2R_1R_2}}$$

Where $A_{HP}=1+R_3/R_4$

6. Electrical Characteristics

6.1 Absolute Maximum Ratings

Condition	Min	Max
Power Supply Voltage (V_{DD} to Vss)	-0.5V	+7V
Analog Input Voltage (IN+ or IN-)	Vss-0.5V	V_{DD}+0.5V
PDB Input Voltage	Vss-0.5V	+7V
Operating Temperature Range	-40°C	+85°C
Junction Temperature	+150°C	
Storage Temperature Range	-65°C	+150°C
Lead Temperature (soldering, 10sec)	+300°C	
Package Thermal Resistance (T_A=+25°C)		
MSOP-8, θ_{JA}	210°C	
SOP8, θ_{JA}	130°C	

Note: Stress greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

6.2 Electrical Characteristics

(V_{DD} = +5V, Vss = 0V, V_{CM} = V_{DD}/2, V_{OUT} = V_{DD}/2, R_L=100K tied to V_{DD}/2, SHDNB = V_{DD}, T_A = -40°C to 85°C, unless otherwise noted. Typical values are at T_A =+25°C.) (Notes 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNIS
Supply-Voltage Range	V_{DD}	Guaranteed by the PSRR test	1.4		5.5	V
Quiescent Supply Current		VDD = 5V		1.0	2.0	μA
(per Amplifier)	I_Q	Shutdown Mode (PDB = V_{SS})		0.1		μA
