

LMH664x Low Power, 130 MHz, 75 mA Rail-to-Rail Output Amplifiers

1 Features

($V_S = \pm 5\text{ V}$, $T_A = 25^\circ\text{C}$, $R_L = 2\text{ k}\Omega$, $A_V = +1$. Typical Values Unless Specified).

- -3 dB BW ($A_V = +1$) 130 MHz
- Supply Voltage Range 2.7 V to 12.8 V
- Slew Rate, ($A_V = -1$) $130\text{V}/\mu\text{s}$ ⁽¹⁾
- Supply Current (no load) 2.7 mA/amp
- Output Short Circuit Current +115 mA to 145 mA
- Linear Output Current $\pm 75\text{ mA}$
- Input Common Mode Volt. 0.5 V Beyond V^- , 1 V from V^+
- Output Voltage Swing 40 mV from Rails
- Input Voltage Noise (100 kHz) $17\text{nV}/\sqrt{\text{Hz}}$
- Input Current Noise (100 kHz) $0.9\text{pA}/\sqrt{\text{Hz}}$
- THD (5MHz, $R_L = 2\text{ k}\Omega$, $V_O = 2V_{PP}$, $A_V = +2$) -62 dBc
- Settling Time 68 ns
- Fully Characterized for 3 V, 5 V, and $\pm 5\text{ V}$
- Overdrive Recovery 100 ns
- Output Short Circuit Protected⁽²⁾
- No Output Phase Reversal with CMVR Exceeded

⁽¹⁾ Slew rate is the average of the rising and falling slew rates

⁽²⁾ Output short circuit duration is infinite for $V_S < 6\text{ V}$ at room temperature and below. For $V_S > 6\text{ V}$, allowable short circuit duration is 1.5 ms.

2 Applications

- Active Filters
- CD/DVD ROM
- ADC Buffer Amp
- Portable Video
- Current Sense Buffer

3 Description

The LMH664X family true single supply voltage feedback amplifiers offer high speed (130 MHz), low distortion (-62 dBc), and exceptionally high output current (approximately 75 mA) at low cost and with reduced power consumption when compared against existing devices with similar performance.

Input common mode voltage range extends to 0.5 V below V^- and 1 V from V^+ . Output voltage range extends to within 40 mV of either supply rail, allowing wide dynamic range especially desirable in low voltage applications. The output stage is capable of approximately 75 mA in order to drive heavy loads. Fast output Slew Rate ($130\text{ V}/\mu\text{s}$) ensures large peak-to-peak output swings can be maintained even at higher speeds, resulting in exceptional full power bandwidth of 40 MHz with a 3 V supply. These characteristics, along with low cost, are ideal features for a multitude of industrial and commercial applications.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMH6642	SOT-23 (5)	2.90 mm x 1.60 mm
	SOIC (8)	4.90 mm x 3.91 mm
LMH6643	SOIC (8)	3.00 mm x 3.00 mm
	VSSOP (8)	
LMH6644	SOIC (14)	8.64 mm x 3.91 mm
	TSSOP (14)	5.00 mm x 4.40 mm

⁽¹⁾ For all available packages, see the orderable addendum at the end of the datasheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision P (March 2013) to Revision Q	Page
• Added, revised, or updated the following sections: Device Information Table, Application and Implementation; Power Supply Recommendations; Device and Documentation Support; Mechanical, Packaging, and Ordering Information	1
• Changed "Junction Temperature Range" to "Operating Temperature Range"	5
• Deleted $T_J = 25^\circ\text{C}$ for Electrical Characteristics tables.	6
• Changed from " R_L " to " R_f "	6
• Deleted $T_J = 25^\circ\text{C}$ for Typical Performance Characteristics	12

Changes from Revision O (March 2013) to Revision P	Page
• Changed layout of National Data Sheet to TI format	1

5 Description (continued)

Careful attention has been paid to ensure device stability under all operating voltages and modes. The result is a very well behaved frequency response characteristic (0.1dB gain flatness up the 12 MHz under 150 Ω load and $A_V = +2$) with minimal peaking (typically 2dB maximum) for any gain setting and under both heavy and light loads. This along with fast settling time (68ns) and low distortion allows the device to operate well in an ADC buffer as well as high frequency filter applications.

This device family offers professional quality video performance with low DG (0.01%) and DP (0.01°) characteristics. Differential Gain and Differential Phase characteristics are also well maintained under heavy loads (150 Ω) and throughout the output voltage range. The LMH664X family is offered in single (LMH6642), dual (LMH6643), and quad (LMH6644) options.

6 Pin Configuration and Functions

Pin Functions

NAME	PIN				I/O	DESCRIPTION
	LMH6642		LMH6643	LMH6644		
	DBV05A	D08A	DGK08A	D14A and PW14A

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾⁽²⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _{IN} Differential			±2.5	V
Output Short Circuit Duration		See ⁽³⁾ and ⁽⁴⁾		
Supply Voltage (V ⁺ - V ⁻)			13.5	V
Voltage at Input/Output pins			V ⁺ +0.8 V ⁻ -0.8	V
Input Current			±10	mA
Junction Temperature ⁽⁵⁾			+150	°C
Soldering Information	Infrared or Convection Reflow (20 sec)		235	°C
	Wave Soldering Lead Temp.(10 sec)		260	°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.
- (2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (3) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C.
- (4) Output short circuit duration is infinite for V_S < 6V at room temperature and below. For V_S > 6V, allowable short circuit duration is 1.5ms.
- (5) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PC board.

7.2 Handling Ratings

		MIN	MAX	UNIT
T _{stg}	Storage temperature range	-65	+150	°C
V _(ESD)	Electrostatic discharge ⁽¹⁾	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽²⁾	2000	V
		Machine model (MM) ⁽³⁾	200	
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽⁴⁾	1000	

- (1) Human body model, 1.5 kΩ in series with 100 pF. Machine Model, 0 Ω in series with 200 pF.
- (2) JEDEC document JEP155 states that 2000-V HBM allows safe manufacturing with a standard ESD control process.
- (3) JEDEC document JEP157 states that 200-V MM allows safe manufacturing with a standard ESD control process.
- (4) JEDEC document JEP157 states that 1000-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply Voltage (V ⁺ - V ⁻)		2.7	12.8	V
Operating Temperature Range ⁽²⁾		-40	+85	°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.
- (2) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PC board.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMH6642		LMH6643	LMH6644		UNIT
		DBV05A	D08A	DGK08A	D14A	PW14A	
		5 PINS	8 PINS	8 PINS	14 PINS	14 PINS	
R _{θJA}	Junction-to-ambient Thermal Resistance ⁽²⁾	265	190	235	145	155	°C/W

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PC board.

7.5 3V Electrical Characteristics

Unless otherwise specified, all limits ensured for $V^+ = 3V$, $V^- = 0V$, $V_{CM} = V_O = V^+/2$, V_{ID} (input differential voltage) as noted (where applicable) and $R_L = 2k\Omega$ to $V^+/2$.

PARAMETER	TEST CONDITIONS	AT TEMPERATURE EXTREMES			$V^+ = 3V$, $V^- = 0V$, $V_{CM} = V_O = V^+/2$, V_{ID} $R_L = 2k\Omega$ to $V^+/2$			UNIT
		MIN	TYP	MAX	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	
BW	-3dB BW	$A_V = +1$, $V_{OUT} = 200mV_{PP}$			80	115		MHz
		$A_V = +2$, -1 , $V_{OUT} = 200mV_{PP}$				46		
$BW_{0.1dB}$	0.1dB Gain Flatness	$A_V = +2$, $R_L = 150\Omega$ to $V^+/2$, $R_f = 402\Omega$, $V_{OUT} = 200mV_{PP}$				19		MHz
PBW	Full Power Bandwidth	$A_V = +1$, $-1dB$, $V_{OUT} = 1V_{PP}$				40		MHz

CMVR	Input Common-Mode Voltage Range	CMRR $\geq 50dB$			-5.1	-5.5	-5.2	V
					3.6	3.8	4.0	
CMRR	Common Mode Rejection Ratio	V_{CM} Stepped from -5V to 3.5V				74	95	dB

- (1) All limits are ensured by testing or statistical analysis.
- (2) Typical values represent the most likely parametric norm.
- (3) Slew rate is the average of the rising and falling slew rates.
- (4) Offset voltage average drift determined by dividing the change in V_{OS} at temperature extremes by the total temperature change.
- (5) Positive current corresponds to current flowing into the device.

±5V Electrical Characteristics (continued)

Unless otherwise specified, all limits ensured for $V^+ = 5V$, $V^- = -5V$, $V_{CM} = V_O = 0V$, V_{ID} (input differential voltage) as noted (where applicable) and $R_L = 2k\Omega$ to ground.

PARAMETER	TEST CONDITIONS	AT TEMPERATURE EXTREMES			$V^+ = 5V$, $V^- = -5V$, $V_{CM} = V_O = 0V$, V_{ID}			UNIT
		MIN	TYP	MAX	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	
A_{VOL}	Large Signal Voltage Gain	$V_O = -4.5V$ to $4.5V$, $R_L = 2k\Omega$	84			88	96	dB
		$V_O = -4.0V$ to $4.0V$, $R_L = 150\Omega$	74			78	82	
V_O	Output Swing High	$R_L = 2k\Omega$, $V_{ID} = 200mV$				4.90	4.96	V
		$R_L = 150\Omega$, $V_{ID} = 200mV$				4.65	4.80	
	Output Swing Low	$R_L = 2k\Omega$, $V_{ID} = -200mV$				-4.96	-4.90	V
		$R_L = 150\Omega$, $V_{ID} = -200mV$				-4.80	-4.65	
I_{SC}	Output Short Circuit Current	Sourcing to Ground $V_{ID} = 200mV$ ⁽⁶⁾⁽⁷⁾	35			60	115	mA
		Sinking to Ground $V_{ID} = -200mV$ ⁽⁶⁾⁽⁷⁾	65			85	145	
I_{OUT}	Output Current	$V_O = 0.5V$ from either supply				±75		mA
PSRR	Power Supply Rejection Ratio	$(V^+, V^-) = (4.5V, -4.5V)$ to $(5.5V, -5.5V)$				78	90	dB
I_S	Supply Current (per channel)	No Load			5.50	2.70	4.50	mA

(6) Short circuit test is a momentary test. See ⁽⁷⁾.

(7) Output short circuit duration is infinite for $V_S < 6V$ at room temperature and below. For $V_S > 6V$, allowable short circuit duration is 1.5ms.

8 Detailed Description

8.1 Overview

The LMH664X family is based on proprietary VIP10 dielectrically isolated bipolar process. This device family architecture features the following:

- Complimentary bipolar devices with exceptionally high f_t (~8 GHz) even under low supply voltage (2.7 V) and low bias current.
- A class A-B “turn-around” stage with improved noise, offset, and reduced power dissipation compared to similar speed devices (patent pending).
- Common Emitter push-push output stage capable of 75 mA output current (at 0.5 V from the supply rails) while consuming only 2.7 mA of total supply current per channel. This architecture allows output to reach within mV of either supply rail.
- Consistent performance over the entire operating supply voltage range with little variation for the most important specifications (for example, BW, SR, I_{OUT} , and so forth)
- Significant power saving (~40%) compared to competitive devices on the market with similar performance.

8.2 Functional Block Diagram

Figure 54. Input Equivalent Circuit

8.3 Feature Description

The LMH664X family is a drop-in replacement for the AD805X family of high speed Op Amps in most applications. In addition, the LMH664X will typically save about 40% on power dissipation, due to lower supply current, when compared to competition. All AD805X family’s specified parameters are included in the list of LMH664X ensured specifications in order to ensure equal or better level of performance. However, as in most high performance parts, due to subtleties of applications, it is strongly recommended that the performance of the part to be evaluated is tested under actual operating conditions to ensure full compliance to all specifications.

8.4 Device Functional Modes

With 3-V supplies and a common mode input voltage range that extends 0.5 V below V^- , the LMH664X find applications in low voltage/low power applications. Even with 3-V supplies, the -3dB BW (@ $A_V = +1$) is typically 115 MHz with a tested limit of 80 MHz. Production testing guarantees that process variations will not compromise speed. High frequency response is exceptionally stable, confining the typical -3dB BW over the industrial temperature range to $\pm 2.5\%$.

As seen in [Typical Performance Characteristics](#), the LMH664X output current capability (~75 mA) is enhanced compared to AD805X. This enhancement increases the output load range, adding to the LMH664X’s versatility. Since LMH664X is capable of high output current, device junction temperature should not to exceed the Absolute Maximum Ratings.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

This device family was designed to avoid output phase reversal. With input overdrive, the output is kept near supply rail (or as closed to it as mandated by the closed loop gain setting and the input voltage). See [Figure 56](#).

However, if the input voltage range of -0.5 V to 1 V from V^+ is exceeded by more than a diode drop, the internal ESD protection diodes will start to conduct. The current in the diodes should be kept at or below 10 mA .

Output overdrive recovery time is less than 100 ns as can be seen in [Figure 57](#).

9.2 Typical Application

Figure 55. Single Supply Photodiode I-V Converter

9.2.1 Design Requirements

The circuit shown in [Figure 55](#) is used to amplify the current from a photodiode into a voltage output. In this circuit, the emphasis is on achieving high bandwidth and the transimpedance gain setting is kept relatively low. Because of its high slew rate limit and high speed, the LMH664X family lends itself well to such an application. This circuit achieves approximately 1 V/mA of transimpedance gain and capable of handling up to 1 mA_{pp} from the photodiode. Q1, in a common base configuration, isolates the high capacitance of the photodiode (C_d) from the Op Amp input in order to maximize speed. Input is AC coupled through C1 to ease biasing and allow single supply operation. With 5-V single supply, the device input/output is shifted to near half supply using a voltage divider from VCC. Note that Q1 collector does not have any voltage swing and the Miller effect is minimized. D1, tied to Q1 base, is for temperature compensation of Q1's bias point. Q1 collector current was set to be large enough to handle the peak-to-peak photodiode excitation and not too large to shift the U1 output too far from mid-supply.

Typical Application (continued)

9.2.1.1 Input and Output Topology

All input / output pins are protected against excessive voltages by ESD diodes connected to V^+ and V^- rails (see [Figure 54](#)). These diodes start conducting when the input / output pin voltage approaches $1V_{be}$ beyond V^+ or V^- to protect against over voltage. These diodes are normally reverse biased. Further protection of the inputs is provided by the two resistors (R in [Figure 54](#)), in conjunction with the string of anti-parallel diodes connected between both bases of the input stage. The combination of these resistors and diodes reduces excessive differential input voltages approaching $2V_{be}$. This occurs most commonly when the device is used as a comparator (or with little or no feedback) and the device inputs no longer follow each other. In such a case, the diodes may conduct. As a consequence, input current increases and the differential input voltage is clamped. It is important to make sure that the subsequent current flow through the device input pins does not violate the Absolute Maximum Ratings of the device. To limit the current through this protection circuit, extra series resistors can be placed. Together with the built-in series resistors of several hundred ohms, these external resistors can limit the input current to a safe number (that is, less than 10mA). Be aware that these input series resistors may impact the switching speed of the device and could slow down the device.

9.2.1.2 Single Supply, Low Power Photodiode Amplifier

The circuit shown in [Figure 55](#) is used to amplify the current from a photodiode into a voltage output. In this circuit, the emphasis is on achieving high bandwidth and the transimpedance gain setting is kept relatively low. Because of its high slew rate limit and high speed, the LMH664X family lends itself well to such an application.

This circuit achieves approximately 1V/mA of transimpedance gain and capable of handling up to $1mA_{pp}$ from the photodiode. Q1, in a common base configuration, isolates the high capacitance of the photodiode (C_d) from the Op Amp input in order to maximize speed. Input is AC coupled through C1 to ease biasing and allow single supply operation. With 5V single supply, the device input/output is shifted to near half supply using a voltage divider from V_{CC} . Note that Q1 collector does not have any voltage swing and the Miller effect is minimized. D1, tied to Q1 base, is for temperature compensation of Q1's bias point. Q1 collector current was set to be large enough to handle the peak-to-peak photodiode excitation and not too large to shift the U1 output too far from mid-supply.

No matter how low an R_f is selected, there is a need for C_f in order to stabilize the circuit. The reason for this is that the Op Amp input capacitance and Q1 equivalent collector capacitance together (C_{IN}) will cause additional phase shift to the signal fed back to the inverting node. C_f will function as a zero in the feedback path counteracting the effect of the C_{IN} and acting to stabilize the circuit. By proper selection of C_f such that the Op Amp open loop gain is equal to the inverse of the feedback factor at that frequency, the response is optimized with a theoretical 45° phase margin.

$$C_F = \sim \text{SQRT} \left[\frac{C_{IN}}{2\pi \cdot \text{GBWP} \cdot R_F} \right]$$

where

- GBWP is the Gain Bandwidth Product of the Op Amp (1)

Optimized as such, the I-V converter will have a theoretical pole, f_p , at:

$$f_p = \text{SQRT} \left[\frac{\text{GBWP}}{2\pi R_F \cdot C_{IN}} \right] \quad (2)$$

With Op Amp input capacitance of 3pF and an estimate for Q1 output capacitance of about 3pF as well, $C_{IN} = 6$ pF. From the typical performance plots, LMH6642/6643 family GBWP is approximately 57 MHz. Therefore, with $R_f = 1k$, from [Equation 1](#) and [Equation 2](#):

$$C_f = \sim 4.1 \text{ pF and } f_p = 39 \text{ MHz} \quad (3)$$

For this example, optimum C_f was empirically determined to be around 5 pF. This time domain response is shown in [Figure 58](#) below showing about 9 ns rise/fall times, corresponding to about 39 MHz for f_p . The overall supply current from the +5 V supply is around 5 mA with no load.

Typical Application (continued)

9.2.2 Detailed Design Procedure

No matter how low an R_f is selected, there is a need for C_f in order to stabilize the circuit. The reason for this is that the Op Amp input capacitance and Q1 equivalent collector capacitance together (C_{IN}) will cause additional phase shift to the signal fed back to the inverting node. C_f will function as a zero in the feedback path counteracting the effect of the C_{IN} and acting to stabilize the circuit. By proper selection of C_f such that the Op Amp open loop gain is equal to the inverse of the feedback factor at that frequency, the response is optimized with a theoretical 45° phase margin where GBWP is the Gain Bandwidth Product of the Op Amp, Optimized as such, the I-V converter will have a theoretical pole, f_p , at: (2) With Op Amp input capacitance of 3pF and an estimate for Q1 output capacitance of about 3pF as well, $C_{IN} = 6$ pF. From the typical performance plots, LMH6642/6643 family GBWP is approximately 57 MHz. Therefore, with $R_f = 1k$, from Equation 2 and Equation 3 : $C_f = \sim 4.1$ pF and $f_p = 39$ MHz.

Single Supply Photodiode I-V Converter For this example, optimum C_f was empirically determined to be around 5 pF. This time domain response is shown in Figure 58 showing about 9 ns rise/fall times, corresponding to about 39 MHz for f_p . The overall supply current from the +5 V supply is around 5 mA with no load.

9.2.3 Application Curves

10 Power Supply Recommendations

The LMH664x device family can operate off a single supply or with dual supplies. The input CM capability of the parts (CMVR) extends all the way down to the V_- rail to simplify single supply applications. Supplies should be decoupled with low inductance, often ceramic, capacitors to ground less than 0.5 inches from the device pins. The use of ground plane is recommended, and as in most high speed devices, it is advisable to remove ground plane close to device sensitive pins such as the inputs.

11 Layout

11.1 Layout Guidelines

Generally, a good high frequency layout will keep power supply and ground traces away from the inverting input and output pins. Parasitic capacitances on these nodes to ground will cause frequency response peaking and possible circuit oscillations (see Application Note OA-15, "Frequent Faux Pas in Applying Wideband Current Feedback Amplifiers", [SNOA367](#), for more information). Texas Instruments suggests the following evaluation boards as a guide for high frequency layout and as an aid in device testing and characterization:

Table 1. Printed Circuit Board Layout And Component Values

DEVICE	PACKAGE	EVALUATION BOARD PN
LMH6642MF	5-Pin SOT-23	LMH730216
LMH6642MA	8-Pin SOIC	LMH730227
LMH6643MA	8-Pin SOIC	LMH730036
LMH6643MM	8-Pin VSSOP	LMH730123
LMH6644MA	14-Pin SOIC	LMH730231
LMH6644MT	14-Pin TSSOP	LMH730131

Another important parameter in working with high speed/high performance amplifiers, is the component values selection. Choosing external resistors that are large in value will effect the closed loop behavior of the stage because of the interaction of these resistors with parasitic capacitances. These capacitors could be inherent to the device or a by-product of the board layout and component placement. Either way, keeping the resistor values lower, will diminish this interaction to a large extent. On the other hand, choosing very low value resistors could load down nodes and will contribute to higher overall power dissipation.

11.2 Layout Example

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

DBV (R-PDSO-G5)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
 - D. Falls within JEDEC MO-178 Variation AA.

DBV (R-PDSO-G5)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - D. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

D (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
 - Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
 - E. Reference JEDEC MS-012 variation AB.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
