General Description

The LP62S4096G-I is a low operating current 4,194,304-bit static random access memory organized as 524,288 words by 8 bits and operates on a low power supply range: 2.7V to 3.3V. It is built using AMIC's high performance CMOS process.

Inputs and three-state outputs are TTL compatible and allow for direct interfacing with common system bus structures.

Two chip enable inputs are provided for POWER-DOWN and device enable and an output enable input is included for easy interfacing.

Data retention is guaranteed at a power supply voltage as low as 2V.

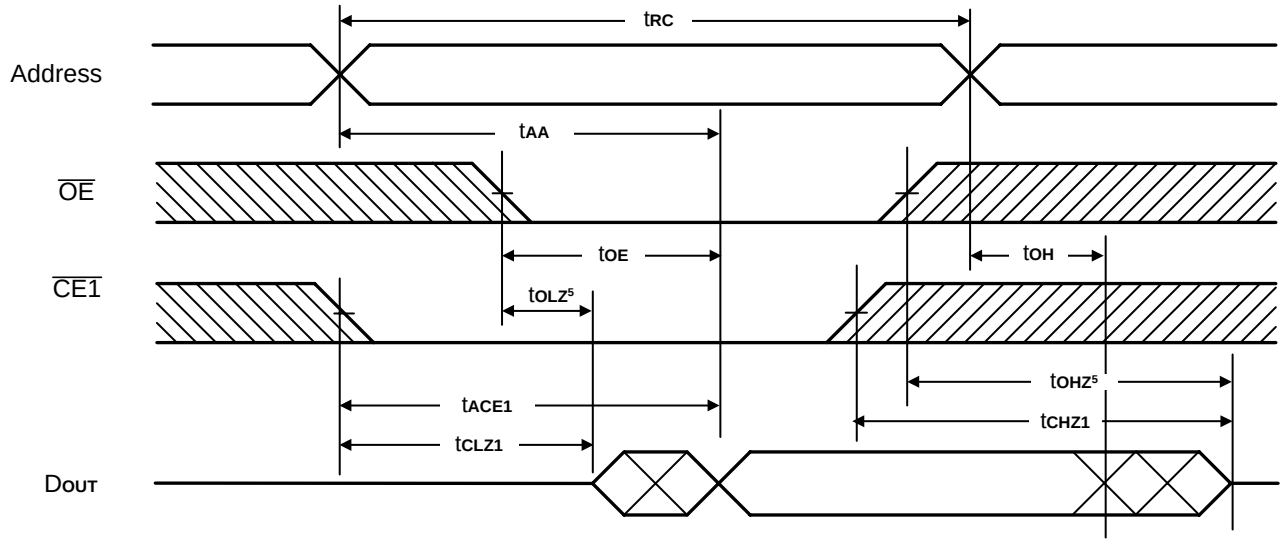
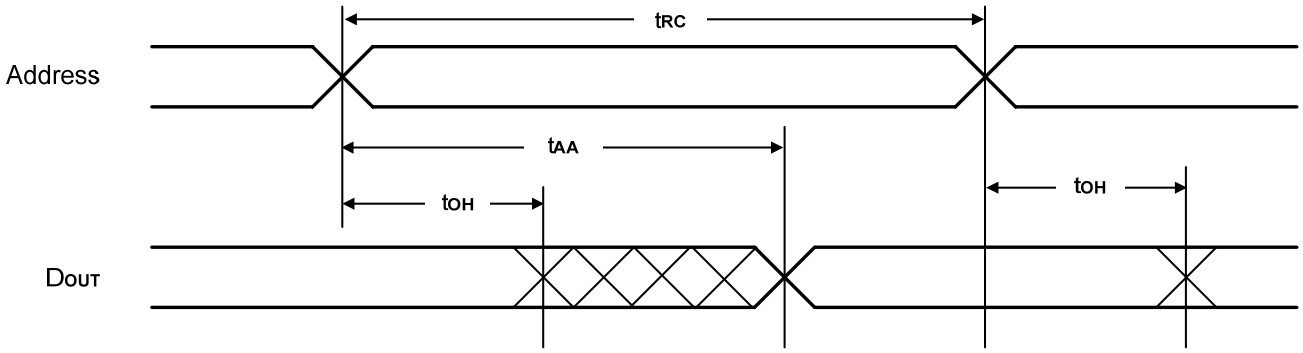
Timing Waveforms

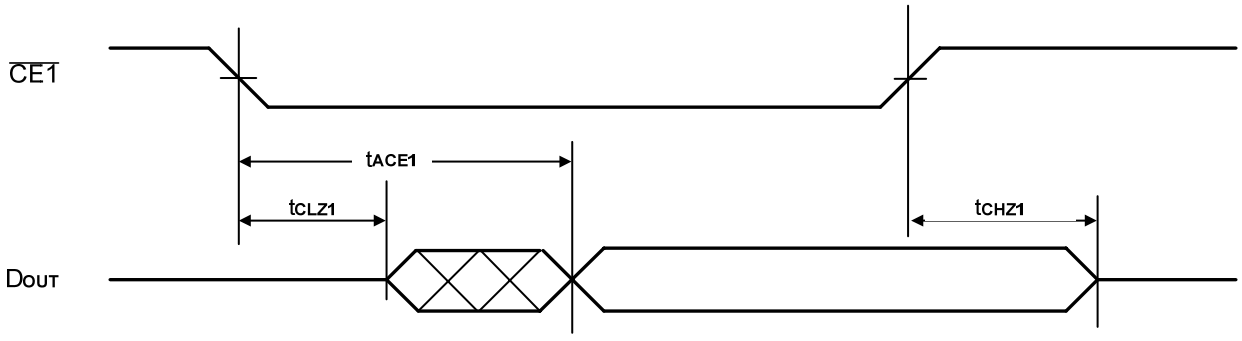
Read Cycle 1 (1)



Read Cycle 2 (1, 2, 4)



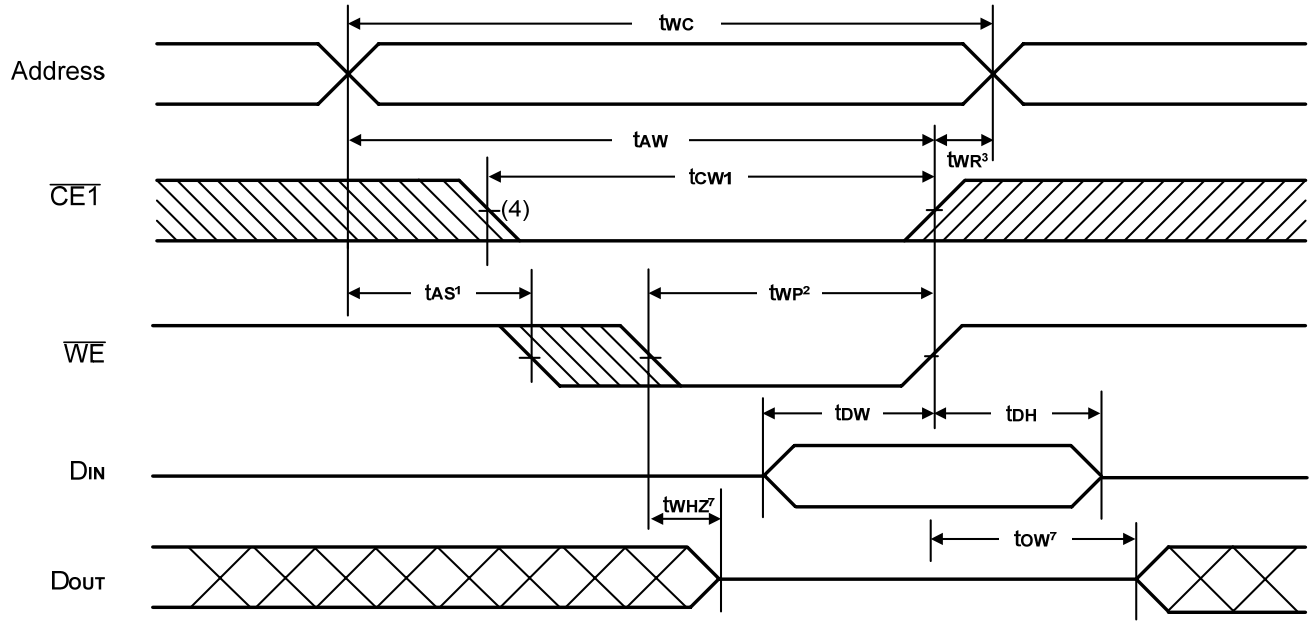
Read Cycle 3 (1, 3, 4)



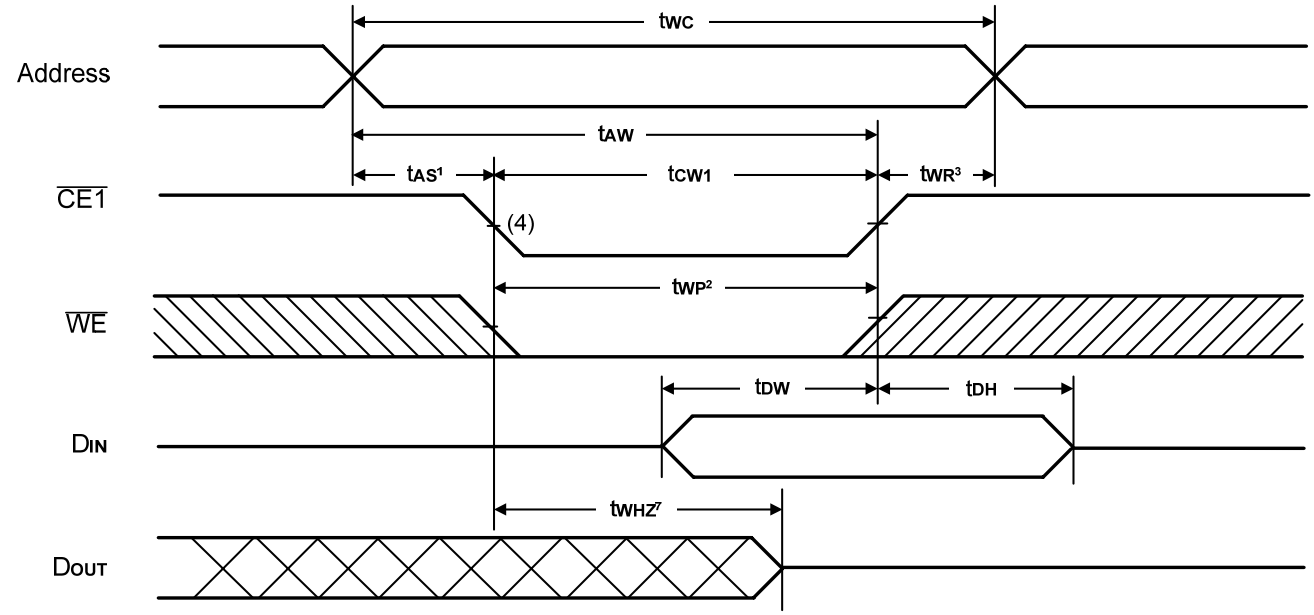
Notes: 1. $\overline{WE}$ is high for Read Cycle.
2. Device is continuously enabled, $\overline{CE1}$ = V_{IL}
3. Address valid prior to or coincident with $\overline{CE1}$ transition low.
4. $\overline{OE}$ = V_{IL}.
5. Transition is measured ±500mV from steady state. This parameter is sampled and not 100% tested.

Timing Waveforms (continued)

Write Cycle 1[6]
(Write Enable Controlled)



Write Cycle 2[6]
(Chip Enable Controlled)



Notes: 1. t_{AS} is measured from the address valid to the beginning of Write.
2. A Write occurs during the overlap (t_{WP}) of a low $\overline{CE1}$ and a low $\overline{WE}$.
3. t_{WR} is measured from the earliest of $\overline{CE1}$ or $\overline{WE}$ going high to the end of the Write cycle.
4. If the $\overline{CE1}$ low transition occurs simultaneously with the $\overline{WE}$ low transition or after the $\overline{WE}$ transition, outputs remain in a high impedance state.
5. t_{CW} is measured from the later of $\overline{CE1}$ going low to the end of Write.
6. $\overline{OE}$ level is high or low.
7. Transition is measured ± 500mV from steady state. This parameter is sampled and not 100% tested.
